

**Listing of the Claims:**

The following is a complete listing of all the claims in the application, with an indication of the status of each:

Claims 1 to 15 are canceled.

1        16 (Original). A computer system comprising:  
2                a system unit having a generally rectangular shape;  
3                a display hinged at one edge of the system unit, said display being  
4        rotated away from the system unit when the computer system is in  
5        operation and rotated against the system unit when the computer system is  
6        not in operation;  
7                detecting means associated with the display for detecting when a  
8        user wants to operate the computer system and when the user wants turn  
9        the computer system off; and  
10               an automatic on and off function implemented on the computer  
11        system and responsive to said detecting means for turning on said  
12        computer system and performing an initial program load of an operating  
13        system installed on the computer system when the display is rotated away  
14        from the system unit and for initiating a shut down procedure of any open  
15        applications and the operating system when the display is rotated against  
16        the system unit.

1        17 (Original). The computer system recited in claim 16, wherein the  
2        computer system may optionally be placed on a horizontal work surface or  
3        mounted under a cabinet or shelf, the computer system further comprising  
4        orientation means for detecting an orientation of the computer system as  
5        either on a horizontal work surface or mounted under a cabinet or shelf,  
6        said automatic on and off function being further responsive to said  
7        orientation means for rotating display information to the display during the

8 initial program load of the operating system so that a displayed image is  
9 oriented right side up.

1 18 (Original). The computer system recited in claim 16, wherein the  
2 detecting means detects a position of the display as either rotated away  
3 from the system unit, indicating that the computer system is to be turned  
4 on, or rotated against the system unit, indicating that the computer system  
5 is to be turned off.

1 19 (Original). The computer system recited in claim 16, wherein the  
2 display is hinged along a front edge of the system unit.

1 20 (Original). The computer system recited in claim 19, further comprising  
2 a protective cover hinged along a back edge of the computer system, the  
3 protective cover being rotated to cover and protect the display when the  
4 display is rotated against the system unit and rotated away from the system  
5 unit to allow the display to be rotated away from the system unit.

1 21 (Original). The computer system recited in claim 20, wherein the  
2 detecting means is actuated by movement of the protective cover.

1 22 (Original). The computer system recited in claim 21, wherein the  
2 computer system may optionally be placed on a horizontal work surface or  
3 mounted under a cabinet or shelf, the computer system further comprising  
4 orientation means for detecting an orientation of the computer system as  
5 either on a horizontal work surface or mounted under a cabinet or shelf,  
6 said automatic on and off function being further responsive to said  
7 orientation means for rotating display information to the flat panel display  
8 during the initial program load of the operating system so that a displayed  
9 image is oriented right side up.

1        23 (Original). The computer system recited in claim 16, further comprising  
2        a single user interface button on a front surface of the system unit, the user  
3        interface button allowing a user to control functions of software running on  
4        the computer system by a combination of single and double presses of the  
5        user interface button.

1        24 (Original). The computer system recited in claim 23, wherein the  
2        software includes a multimedia presentation and the single and double  
3        presses of the user interface button control pause, resume and stop  
4        functions of the multimedia presentation.

1        25 (Original). The computer system recited in claim 23, wherein the  
2        software presents a user with choices for making a selection in a displayed  
3        image on the display and the single and double presses of the user interface  
4        button control movement among the displayed choices and selection of one  
5        of the displayed choices.

1        26 (Original). The computer system recited in claim 23, further comprising  
2        a slot on the front face of the computer system for receiving computer  
3        readable media and an eject button for ejecting computer readable media  
4        currently in the slot.

1        27 (Original). The computer system recited in claim 16, further  
2        comprising:  
3                an internal microphone and an internal speaker providing a audible  
4        interface with a user;  
5                a wireless headphone and microphone set providing an alternative  
6        audible interface with the user;  
7                a wireless transceiver attachable to the computer system and

8 communicating with the wireless headphone and microphone set; and  
9 means in the computer system for detecting attachment of the  
10 wireless transceiver to the computer system and inhibiting operation of the  
internal microphone and internal speaker.

1 28 (Original). A computer system for presenting an interactive multimedia  
2 book to a user comprising:  
3 a display for displaying text and video clips of the interactive  
4 multimedia book, some words of the text being hyperlinks to anchors in  
5 text not currently displayed;  
6 a voice recognition function installed on the computer system;  
7 a speech synthesis function installed on the computer system;  
8 a microphone for inputting voiced commands by the user to the  
9 voice recognition function;  
10 at least one speaker for outputting synthesized speech from the  
11 speech synthesis function; and  
12 an application program running on a central processing unit of the  
13 computer system for responding to a voiced command recognized by the  
14 voice recognition function to read text on a displayed page of the  
15 interactive multimedia book by causing the speech synthesis function to  
16 read the text, the application program identifying words which are active  
17 hyperlinks in the text on a displayed page as the text is being read and  
18 activating at least one attribute of a word identified as an active hyperlink  
19 to indicate to the user of the book that the word is a hyperlink, the  
20 application responding to a voiced hyperlink recognized by the voice  
21 recognition function by moving to another page of the book which contains  
22 an anchor for the hyperlink.

1 29 (Original). The computer system recited in claim 28, wherein the  
2 application program displays an icon representative of a video clip on the

3 page of the book which contains an anchor for the hyperlink, the  
4 application program responding to a voiced command recognized by the  
5 voice recognition function to play the video clip by playing the video clip.

1 30 (Original). The computer system recited in claim 29, further comprising  
2 a user interface which allows a user to pause, resume and stop the playing  
3 of the video clip, the application program responding to a user input to  
4 pause the video clip by temporarily halting the playing of the video clip,  
5 responding to a user input to resume playing the video clip by playing the  
6 video clip from a point at which the video clip was temporarily halted, and  
7 responding to a user input to stop playing the video clip by stopping the  
8 playing of the video clip and returning to a main part of the application  
9 program.

1 31 (Original). The computer system recited in claim 30, wherein the user  
2 interface is a single button which when pressed once pauses the playing of  
3 the video clip if the video clip is playing, when pressed again resumes the  
4 playing of the video clip if the video clip is temporarily halted, and when  
5 pressed twice in succession causes the playing of the video clip to be  
6 stopped.

1 32 (Original). The computer system recited in claim 28, wherein said at  
2 least one attribute of a word identified as an active hyperlink is a change in  
3 color, the word on the displayed page changing color when read.

1 33 (Original). The computer system recited in claim 28, wherein said at  
2 least one attribute of a word identified as an active hyperlink is a sound,  
3 the sound being emitted when the word on the displayed page is read.

1 34 (Original). The computer system recited in claim 28, wherein said at  
2 least one attribute of a word identified as an active hyperlink is a change in  
3 color and a sound, the sound being emitted and the word on the displayed  
4 page changing color when read.

1 35 (Original). The computer system recited in claim 28, wherein the voiced  
2 commands which may be spoken by the user of the book and recognized  
3 by the voice recognition function further include a command to list active  
4 hyperlinks on a displayed page.

1 36 (Original). The computer system recited in claim 28, wherein the voiced  
2 commands which may be spoken by the user of the book and recognized  
3 by the voice recognition function further include a command to display an  
4 image of a completed project described on a currently displayed page of  
5 the book.

1 37 (Original). The computer system recited in claim 28, further  
2 comprising:

3 a system unit having a generally rectangular shape, said central  
4 processing unit being housed within the system unit, wherein the display is  
5 a flat panel display hinged at one edge of the system unit, said flat panel  
6 display being rotated away from the system unit when the computer system  
7 is in operation and rotated flat against the system unit when the computer  
8 system is not in operation;

9 detecting means associated with the display for detecting when a  
10 user desires to turn on the computer system and when the user wants to  
11 turn off the computer system; and

12 an automatic on and off function implemented on the computer  
13 system and responsive to said detecting means for turning on said  
14 computer system and performing an initial program load of an operating

15 system installed on the computer system when it is detected that the  
16 computer systems is to be turned on and for initiating a shut down  
17 procedure of any open applications and the operating system when it that  
18 the computer system is to be turned off.

1 38 (Original). The computer system recited in claim 37, wherein the  
2 computer system may optionally be sat on a horizontal work surface or  
3 mounted under a cabinet or shelf, the computer system further comprising  
4 orientation means for detecting an orientation of the computer system as  
5 either on a horizontal work surface or mounted under a cabinet or shelf,  
6 said automatic on and off function being further responsive to said  
7 orientation means for rotating display information to the flat panel display  
8 during the initial program load of the operating system so that a display is  
9 oriented right side up.

1 39 (Original). The computer system recited in claim 37, wherein the  
2 detecting means detects a position of the display as either rotated away  
3 from the system unit or rotated against the system unit.

1 40 (Original). The computer system recited in claim 37, wherein the  
2 display is hinged along a front edge of the system unit.

1 41 (Original). The computer system recited in claim 40, further comprising  
2 a protective cover hinged along a back edge of the computer system, the  
3 protective cover being rotated to cover and protect the flat panel display  
4 when the flat panel display is rotated flat against the system unit and  
5 rotated away from the system unit to allow the flat panel display to be  
6 rotated away from the system unit.

1 42 (Original). The computer system recited in claim 41, wherein the

2 detecting means is actuated by movement of the protective cover.

1 43 (Original). The computer system recited in claim 42, wherein the  
2 computer system may optionally be sat on a horizontal work surface or  
3 mounted under a cabinet or shelf, the computer system further comprising  
4 orientation means for detecting an orientation of the computer system as  
5 either on a horizontal work surface or mounted under a cabinet or shelf,  
6 said automatic on and off function being further responsive to said  
7 orientation means for rotating display information to the flat panel display  
8 during the initial program load of the operating system so that a display is  
9 oriented right side up.

1 44 (Original). The computer system recited in claim 37, further comprising  
2 a single user interface button on a front surface of the system unit, the user  
3 interface button allowing a user to control functions of software running on  
4 the computer system by a combination of single and double presses of the  
5 user interface button.

1 45 (Original). The computer system recited in claim 44, wherein the  
2 software includes a multimedia presentation and the single and double  
3 presses of the user interface button control pause, resume and stop  
4 functions of the multimedia presentation.

1 46 (Original). The computer system recited in claim 44, wherein the  
2 software presents a user with choices for making a selection in a display on  
3 the flat panel display and the single and double presses of the user interface  
4 button control movement among the displayed choices and selection of one  
5 of the displayed choices.

1 47 (Original). The computer system recited in claim 44, further comprising  
2 a slot on the front face of the computer system for receiving computer  
3 readable media and an eject button for ejecting computer readable media  
4 currently in the slot.

1 48 (Original). A computer system for presenting an interactive multimedia  
2 book to a user comprising:  
3 a display for displaying text and video clips of the interactive  
4 multimedia book, some words of the text being hyperlinks to anchors in  
5 text not currently displayed;  
6 a voice recognition function installed on the computer system;  
7 a speech synthesis function installed on the computer system;  
8 a microphone for inputting voiced commands by the user to the  
9 voice recognition function;  
10 at least one speaker for outputting synthesized speech from the  
11 speech synthesis function;  
12 a last in, first out register; and  
13 an application program running on a central processing unit of the  
14 computer system for responding to a voiced hyperlink recognized by the  
15 voice recognition function by first storing a current page number in the last  
16 in, first out register before moving to another page of the book which  
17 contains an anchor for the hyperlink, the current page being an origin page,  
18 and then moving to another page of the book which contains the anchor for  
19 the hyperlink, said application program responding to a voiced command  
20 recognized by the voice recognition function to return to the origin page by  
21 moving back to the origin page.

1 49 (Original). The computer system recited in claim 48, wherein said voice  
2 recognition function recognizes a natural language query spoken by the  
3 user of the book by analyzing the natural language query and responding to

4 the natural language query.

1 50 (Original). The computer system recited in claim 49, wherein the  
2 natural language query includes "WHAT", the analysis of the natural  
3 language query by the voice recognition function analyzing a word or  
4 words following the word "WHAT" and responding to the natural  
5 language query by displaying on the display and causing the speech  
6 synthesis function to speak a definition of the word or words following the  
7 word "WHAT".

1 51 (Original). The computer system recited in claim 49, wherein the  
2 natural language query includes "MAKE", the analysis of the natural  
3 language query by the voice recognition function analyzing a word or  
4 words following the word "MAKE" and responding to the natural  
5 language query by moving to a section of the book which covers a project  
6 or recipe corresponding to the word or words following the word  
7 "MAKE".

1 52 (Original). The computer system recited in claim 49, wherein the  
2 natural language query includes "HOW", the analysis of the natural  
3 language query by the voice recognition function analyzing a word or  
4 words following the word "HOW" and responding to the natural language  
5 query includes by moving to a section of the book which covers a  
6 technique corresponding to the word or words following the word "HOW".

1 53 (Original). The computer system recited in claim 49, wherein the  
2 natural language query includes "GO", the analysis of the natural language  
3 query by the voice recognition function analyzing a word or words  
4 following the word "GO" and responding to the natural language query by  
5 moving to a page or a section of the book which covers a project or recipe

CLW001D

16

6 or a technique corresponding to the word or words following the word  
7 "GO".

Claims 54 to 68 are canceled.
